

5" Blow-In System

We recommend 5" Blow-In System!

With the 5" Blow-In System you reduce the supply pressure significantly.

The media is thereby supplied much gentler which protects the feed pellets from getting crushed and minimises the risk of congestion and overpressure in the silo and the supply system.

You thereby reduce the wear of the entire supply system (e.g cyclone) as well as minimise the deformation significantly which results in lower operational costs.

Benefits of 5" versus 4"

- > Minimises crumbling of the feed during the supply.
- > Smaller risk of congestion.
- > Less wear of the supply system.
- > Faster unloading.
- > Lower operational costs.
- > Smaller risk of overpressure in the silo and the supply system.
